

Damash Minerals

MANDIANA NORTH & SOUTH

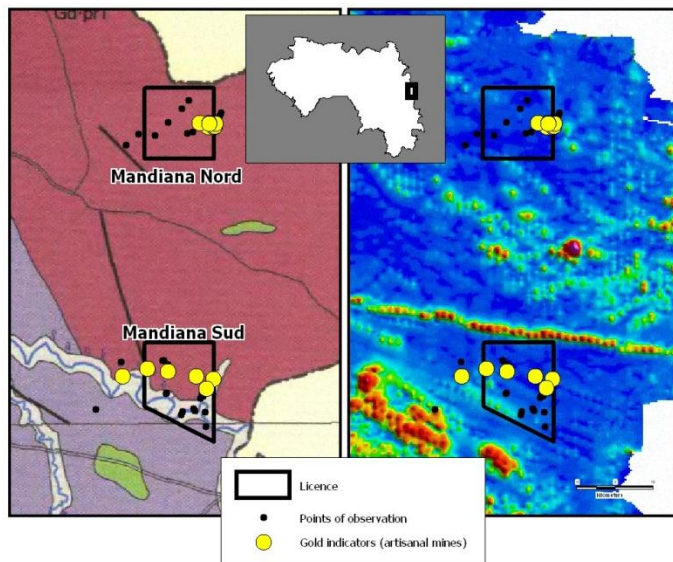

Licence information

MANDIANA NORTH & SOUTH

GENERAL PRESENTATION

There are two license areas, respectively, one with an area of 80 km² and another with 97 km², located in the Municipality of Mandiana.

Fieldwork was conducted over approximately 80 km of reconnaissance trip of the scope of the licenses. 84 samples were taken and analyzed by XRF portable. No samples were sent to an independent laboratory.

Location of artisanal gold mines in the band permission Mandiana North and South (the background maps are the geological map of Guinea, scale 1:1000000 letter and aerial BRGM (Bureau de Recherches et Géologiques Minières))

In the license area and its immediate vicinity is still considered a number of artisanal mining operations. The artisans work up to 7 feet deep ..

It is difficult to determine the type of host rocks and mineralization because of intense change, but the presence of quartz materials gave us reason to believe that gold came from quartz stockwork (called a stockwork a dense network of fine veins). The area is located on a plot of Archean origin..

The area may contain a potential gold mineralization, requiring further investigation. Therefore, it is recommended to carry out a more detailed map, before deciding on an exploration program more comprehensive and complete
